D  
A  
Y

- First Order Logic (Inference)
- Responsible AI

# Logistic notes

- Online ESCI Survey
  - Nearly half the students completed the survey.
  - We can do better! The deadline is **Jun 3 (This Friday)**
  - Please take a moment to complete your feedback!
- Project 3 due **this Thursday**
  - Extra instructor office hour at 2 pm today
- Final exam **next Monday 12 – 3**
  - Open book (no digital devices)
  - Twice the time but only slightly longer than the midterm
  - More details on the Thursday lecture

# Recap: Resolution Rule is just chaining of implications

$$\frac{p \vee q, \quad \neg q \vee r}{p \vee r}$$

Propositional calculus resolution

Remember:  $p \Rightarrow q \Leftrightarrow \neg p \vee q$ , so let's rewrite it as:

$$\frac{\neg p \Rightarrow q, \quad q \Rightarrow r}{\neg p \Rightarrow r}$$

or

$$\frac{a \Rightarrow b, \quad b \Rightarrow c}{a \Rightarrow c}$$

Resolution is really the “chaining” of implications.

# Recap: Conversion to Conjunctive Normal Form: CNF

- Resolution rule is stated for conjunctions of disjunctions
- Question:
  - Can every statement in PL be represented this way?
- Answer: Yes
  - Can show every sentence in propositional logic is equivalent to conjunction of disjunctions
    - Conjunctive normal form (CNF)
- Procedure for obtaining CNF
  - Replace  $(P \Leftrightarrow Q)$  with  $(P \Rightarrow Q)$  and  $(Q \Rightarrow P)$
  - Eliminate implications: Replace  $(P \Rightarrow Q)$  with  $(\neg P \vee Q)$
  - Move  $\neg$  inwards:  $\neg\neg$ ,  $\neg(P \vee Q)$ ,  $\neg(P \wedge Q)$
  - Distribute  $\wedge$  over  $\vee$ , e.g.:  $(P \wedge Q) \vee R$  becomes  $(P \vee R) \wedge (Q \vee R)$   
[What about  $(P \vee Q) \wedge R$  ?]
  - Flatten nesting:  $(P \wedge Q) \wedge R$  becomes  $P \wedge Q \wedge R$

A method of analysis or calculation using a special symbolic notation

# Recap: First-Order Logic (FOL)

- Also known as *First-Order Predicate Calculus*
  - Propositional logic is also known as *Propositional Calculus*
- An extension to propositional logic in which quantifiers can bind variables in sentences
  - Universal quantifier (  $\forall$  )
  - Existential quantifier (  $\exists$  )
  - Variables:  $x, y, z, a, joe, table...$
- Examples
  - $\forall x \text{ Beautiful}(x)$
  - $\exists x \text{ Beautiful}(x)$

# Recap: FOL Syntax

- Symbols
  - Object symbols (constants):  $P$ ,  $Q$ ,  $Fred$ ,  $Desk$ ,  $True$ ,  $False$ , ...
    - These refer to *things*
  - **Predicate** symbols:  $Heavy$ ,  $Smart$ ,  $Mother$ , ...
    - These are *true or false statements* about objects:  $Smart(rock)$
  - **Function** symbols:  $Cosine$ ,  $IQ$ ,  $MotherOf$ , ...
    - These return objects, exposing *relations*:  $IQ(rock)$
  - Variables:  $x$ ,  $y$ ,  $\lambda$ , ...
    - These represent unspecified objects
  - Logical connectives to construct complex sentences:  $\neg$ ,  $\wedge$ ,  $\vee$ ,  $\Rightarrow$ ,  $\Leftrightarrow$
  - Quantifiers:  $\forall$  (universal),  $\exists$  (existential)
  - Equality:  $=$
- Usually variables will be lower-case, other symbols capitalized

**\*Terms:** Constants, variables, (output of) functions

# Recap: Universal and Existential Quantifiers

- Quantifiers:  $\forall$  (universal),  $\exists$  (existential)
- $\forall$  <variables> <sentence>
  - $\forall x$  – “For all  $x$ ...”
  - $\forall x, y$  – “For all  $x$  and  $y$ ...”
  - “All instances must satisfy ...”
- $\exists$  <variables> <sentence>
  - $\exists x$  – “There exists an  $x$  such that...”
  - $\exists x, y$  – “There exist  $x$  and  $y$  such that...”
  - “There is at least one such example such that ...”
- Scope, order, nesting of quantifiers
  - $\exists x \forall y \text{ Loves}(x, y)$
  - $\forall y \exists x \text{ Loves}(x, y)$

## Recap: Kinship domain (cont.)

### Assertions (“Add this sentence to the KB”)

TELL( KB,  $\forall m, c \text{ Mother}(c) = m \Leftrightarrow \text{Female}(m) \wedge \text{Parent}(m, c)$  )

TELL( KB,  $\forall w, h \text{ Husband}(h, w) \Leftrightarrow \text{Male}(h) \wedge \text{Spouse}(h, w)$  )

TELL( KB,  $\forall x \text{ Male}(x) \Leftrightarrow \neg \text{Female}(x)$  )

TELL( KB,  $\text{Female}(\text{Mary}) \wedge \text{Parent}(\text{Mary}, \text{Frank}) \wedge \text{Parent}(\text{Frank}, \text{Ann})$  )

- Note: TELL( KB,  $S1 \wedge S2$  )  $\equiv$  TELL( KB,  $S1$  ) and TELL( KB,  $S2$  )  
(because of and-elimination and and-introduction)

### Queries (“Does the KB entail this sentence?”)

ASK( KB,  $\text{Grandparent}(\text{Mary}, \text{Ann})$  )  $\rightarrow$  True

ASK( KB,  $\exists x \text{ Child}(x, \text{Frank})$  )  $\rightarrow$  True

- But a better answer would be  $\rightarrow \{ x / \text{Ann} \}$
- This returns a **substitution** or **binding**

# Implementing ASK: Inference

- We want a sound and complete inference algorithm so that we can produce (or confirm) *entailed* sentences from the KB

$$\text{KB} \models \alpha \qquad \text{KB} \vdash \alpha$$

- The **resolution** rule, along with a complete search algorithm, provides a complete inference algorithm to confirm or refute a sentence  $\alpha$  in propositional logic (Sec. 7.5)
  - Based on *proof by contradiction* (refutation)
- Refutation: To prove that the KB entails P, assume  $\neg P$  and show a contradiction:

$$(\text{KB} \wedge \neg P \Rightarrow \text{False}) \equiv (\text{KB} \Rightarrow P)$$

Prove this!

# Inference in First-Order Logic

- Inference rules for propositional logic:
  - Modus ponens, and-elimination, and-introduction, or-introduction, resolution, etc.
  - These are valid for FOL also
- But since these don't deal with quantifiers and variables, we need new rules, especially those that allow for substitution (binding) of variables to objects
  - These are called *lifted* inference rules

# Substitution and variable binding

- Notation for substitution:
  - SUBST( **Binding list**, **Sentence** )
    - Binding list:  $\{ var / \text{ground term}, var / \text{ground term}, \dots \}$
    - “ground term” = term with no variables
  - SUBST(  $\{var/gterm\}$ , Func( $var$ ) ) = Func(gterm)
    - SUBST( $\theta$ , p)
  - Examples:
    - SUBST(  $\{x/Mary\}$ , FatherOf( $x$ ) ) = FatherOf(Mary)
    - SUBST(  $\{x/Joe, y/Lisa\}$ , Siblings( $x,y$ ) ) = Siblings(Joe, Lisa)

# Three new inference rules using $SUBST(\theta, p)$

- Universal Instantiation

$$\frac{\forall v \quad \alpha}{SUBST(\{v / g\}, \alpha)}$$

$g$  – ground term

- Existential Instantiation

$$\frac{\exists v \quad \alpha}{SUBST(\{v / k\}, \alpha)}$$

$k$  – constant that does not appear elsewhere in the knowledge base

- Existential Introduction

$$\frac{\alpha}{\exists v \quad SUBST(\{g / v\}, \alpha)}$$

$v$  – variable not in  $\alpha$   
 $g$  – ground term in  $\alpha$

## To Add to These Rules

- ◇ **Modus Ponens** or **Implication-Elimination**: (From an implication and the premise of the implication, you can infer the conclusion.)

$$\frac{\alpha \Rightarrow \beta, \quad \alpha}{\beta}$$

- ◇ **And-Elimination**: (From a conjunction, you can infer any of the conjuncts.)

$$\frac{\alpha_1 \wedge \alpha_2 \wedge \dots \wedge \alpha_n}{\alpha_i}$$

- ◇ **And-Introduction**: (From a list of sentences, you can infer their conjunction.)

$$\frac{\alpha_1, \alpha_2, \dots, \alpha_n}{\alpha_1 \wedge \alpha_2 \wedge \dots \wedge \alpha_n}$$

- ◇ **Or-Introduction**: (From a sentence, you can infer its disjunction with anything else at all.)

$$\frac{\alpha_i}{\alpha_1 \vee \alpha_2 \vee \dots \vee \alpha_n}$$

- ◇ **Double-Negation Elimination**: (From a doubly negated sentence, you can infer a positive sentence.)

$$\frac{\neg\neg\alpha}{\alpha}$$

- ◇ **Unit Resolution**: (From a disjunction, if one of the disjuncts is false, then you can infer the other one is true.)

$$\frac{\alpha \vee \beta, \quad \neg\beta}{\alpha}$$

- ◇ **Resolution**: (This is the most difficult. Because  $\beta$  cannot be both true and false, one of the other disjuncts must be true in one of the premises. Or equivalently, implication is transitive.)

$$\frac{\alpha \vee \beta, \quad \neg\beta \vee \gamma}{\alpha \vee \gamma} \quad \text{or equivalently} \quad \frac{\neg\alpha \Rightarrow \beta, \quad \beta \Rightarrow \gamma}{\neg\alpha \Rightarrow \gamma}$$

# Universal Instantiation – examples

$$\frac{\forall v \quad \alpha}{\text{SUBST}(\{v / g\}, \alpha)} \quad g - \text{ground term}$$

- $\forall x \text{ Sleepy}(x)$ 
  - $\text{SUBST}(\{x/\text{Joe}\}, \alpha)$ 
    - $\text{Sleepy}(\text{Joe})$
- $\forall x \text{ Mother}(x) \Rightarrow \text{Female}(x)$ 
  - $\text{SUBST}(\{x/\text{Mary}\}, \alpha)$ 
    - $\text{Mother}(\text{Mary}) \Rightarrow \text{Female}(\text{Mary})$
  - $\text{SUBST}(\{x/\text{Dad}\}, \alpha)$ 
    - $\text{Mother}(\text{Dad}) \Rightarrow \text{Female}(\text{Dad})$
- $\forall x, y \text{ Buffalo}(x) \wedge \text{Pig}(y) \Rightarrow \text{Outrun}(x, y)$ 
  - $\text{SUBST}(\{x/\text{Bob}\}, \alpha)$ 
    - $\forall y \text{ Buffalo}(\text{Bob}) \wedge \text{Pig}(y) \Rightarrow \text{Outrun}(\text{Bob}, y)$

# Existential Instantiation – examples

$$\frac{\exists v \quad \alpha}{\text{SUBST}(\{v/k\}, \alpha)}$$

$k$  – constant that does not appear elsewhere in the knowledge base

- $\exists x \text{ BestAction}(x)$ 
  - $\text{SUBST}(\{x/B\_A\}, \alpha)$ 
    - $\text{BestAction}(B\_A)$ 
      - “ $B\_A$ ” is a constant; it is not in our universe of actions
- $\exists y \text{ Likes}(y, \text{Broccoli})$ 
  - $\text{SUBST}(\{y/Bush\}, \alpha)$ 
    - $\text{Likes}(Bush, \text{Broccoli})$ 
      - “ $Bush$ ” is a constant; it is not in our universe of people

# Existential Introduction – examples

$$\frac{\alpha}{\exists v \text{ SUBST}(\{g / v\}, \alpha)}$$

$v$  – variable not in  $\alpha$   
 $g$  – ground term in  $\alpha$

- Likes(Jim, Broccoli)
  - SUBST({Jim/ $\underline{x}$ },  $\alpha$ )
    - $\exists x$  Likes( $x$ , Broccoli)
- $\forall x$  Likes( $x$ , Broccoli)  $\Rightarrow$  Healthy( $x$ )
  - SUBST({Broccoli/ $y$ },  $\alpha$ )
    - $\exists y \forall x$  Likes( $x$ ,  $y$ )  $\Rightarrow$  Healthy( $x$ )

# We can formulate the logical inference problem as a search problem.

- Formulate a **search process**:
  - Initial state
    - KB
  - Operators
    - Inference rules
  - Goal test
    - KB contains S
- What is a node?
  - KB + new sentences (generated by applying the inference rules)
  - In other words, the new state of the KB
- What kind of search to use?
  - I.e., which node to expand next?
- How to apply inference rules?  $\alpha \Rightarrow \beta$ 
  - Need to match the premise pattern  $\alpha$

**Question: What's our goal here?**

# Example of FOL Inference (3 min discussion)

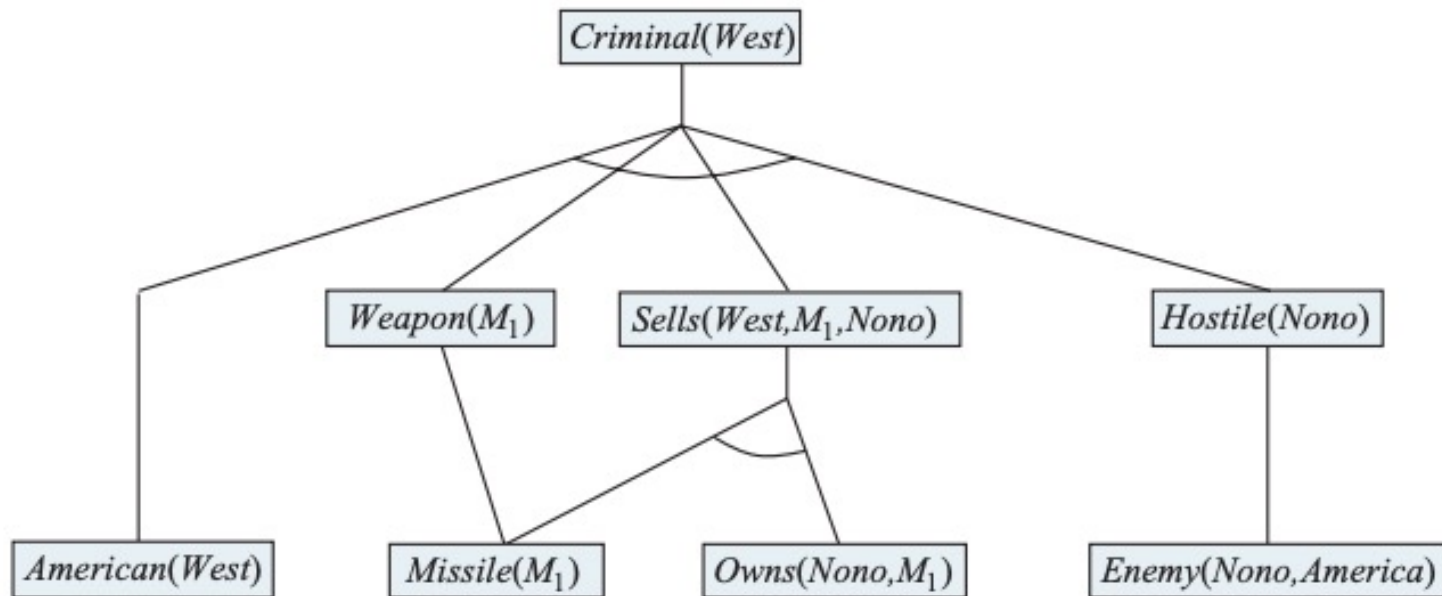

- Problem: “The law says that it is a crime for an American to sell weapons to hostile nations. The country Nono, an enemy of America, has some Missiles, and all of its missiles were sold to it by Colonel West, who is American.”

## 1. How to represent the KB?

American (p)  $\wedge$  weapon(q)  $\wedge$  sells (p, q, r)  $\wedge$  hostile(r)  $\rightarrow$  Criminal(p)

## 2. How to apply various inference rules to prove “Colonel West is criminal”?

# Example of a “Proof tree” of FOL inference

# Inference algorithms in first order logic will not be covered in the final. (FOL will be!)

- However, it is a powerful tool.
  - Expert systems (since 1970s)
  - Large scale industry deployment.
- It is however fragile and rely on the correct / error-free representation of the world in black and white
  - This limits its use in cases when the evidence is collected stochastically and imprecisely by people's opinions in large scale.
- Somewhat superseded by machine learning on many problems, but:
  - Research on logic agent is coming back.
  - Add knowledge and reasoning to ML-based solution
  - After all, ML are just reflex agents usually.

# Future of AI

- More higher level intelligence
  - Logic is coming back
  - But more learning based than rule-based
- More stateful systems, more reinforcement learning
  - Causal modelling and reasoning
- More AI in the non-iid environment
  - Structured
  - Adversarial
- More forms of agent's perception
  - Weak supervision
  - Self-supervision (bootstrapping)

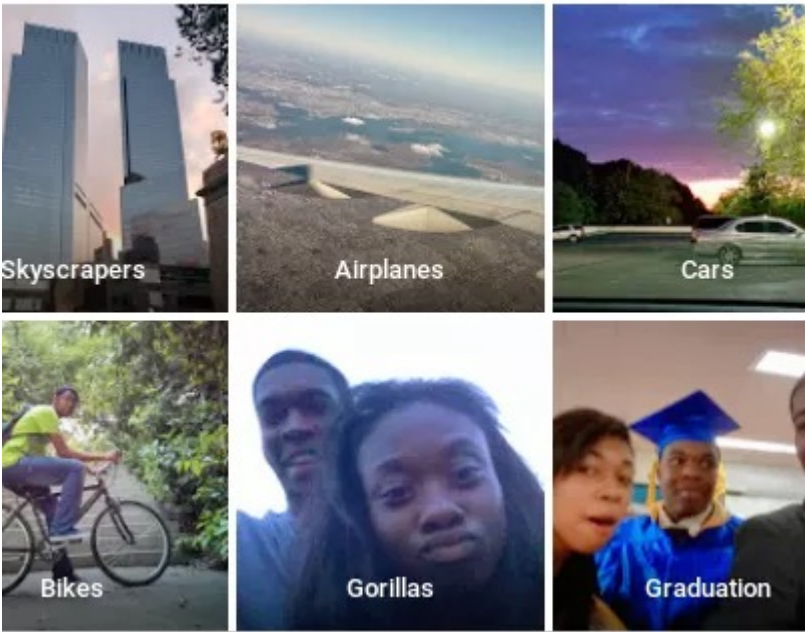

# The need for responsible AI: with great power comes great responsibility

A face recognition system

- Technology is a double-bladed sword
- It matters who wields it and for what purpose

# Fairness challenges in AI systems / AI for decision making

Google's image recognition system

## GENDER-BIASED HIRING TOOL amazon

State Reside	WA
race/ethnicity	white-Non-Hispanic

**MAN, 60, THROWN FROM MOTORCYCLE**  
A 60-year-old Soap Lake man was hospitalized Saturday afternoon after he was thrown from his motorcycle. Ronald Jameson was riding his 2003 Harley-Davidson north on Highway 25, when he failed to negotiate a curve to the left. His motorcycle became airborne before landing in a wooded area. Jameson was thrown from the bike; he was wearing a helmet during the 12:24 p.m. incident. He was taken to Sacred Heart Hospital. The police cited speed as the cause of the crash. # ML models memorize training datasets, even though they are generalizing well!

## Membership Inference Attacks Against Machine Learning Models

Reza Shokri  
Cornell Tech

Marco Stronati\*  
INRIA

Congzheng Song  
Cornell

Vitaly Shmatikov  
Cornell Tech

**Abstract**—We quantitatively investigate how machine learning models leak information about the individual data records on which they were trained. We focus on the basic membership inference attack: given a data record and black-box access to a model, determine if the record was in the model’s training dataset. To perform membership inference against a target model, we make adversarial use of machine learning and train our own inference model to recognize differences in the target model’s predictions on the inputs that it trained on versus the inputs that it did not train on.

We empirically evaluate our inference techniques on classification models trained by commercial “machine learning as a service” providers such as Google and Amazon. Using realistic datasets and classification tasks, including a hospital discharge dataset whose membership is sensitive from the privacy perspective, we show that these models can be vulnerable to membership inference attacks. We then investigate the factors that influence this leakage and evaluate mitigation strategies.

## The Secret Sharer: Measuring Unintended Neural Network Memorization & Extracting Secrets

Nicholas Carlini  
University of California, Berkeley

Chang Liu  
University of California, Berkeley

Jernej Kos  
National University of Singapore

Úlfar Erlingsson  
Google Brain

Dawn Song  
University of California, Berkeley

This paper presents *exposure*, a simple-to-compute metric that can be applied to any deep learning model for measuring the memorization of secrets. Using this metric, we show how to extract those secrets efficiently using black-box API access. Further, we show that unintended memorization occurs early, is not due to overfitting, and is a persistent issue across different types of models, hyperparameters, and training strategies. We experiment with both real-world models (e.g., a state-of-the-art translation model) and datasets (e.g., the Enron email dataset, which contains users’ credit card numbers) to demonstrate both the utility of measuring exposure and the ability to extract secrets.

Finally, we consider many defenses, finding some ineffective (like regularization), and others to lack guarantees. However, by instantiating our own differentially-private recurrent model, we validate that by appropriately investing in the use of state-of-the-art techniques, the problem can be resolved, with high utility.

2019*

# With appropriate prompt, GPT2 outputs sensitive training data verbatim

# Recent/upcoming legislations on privacy forces companies to revise their data practice

- I can't keep personal data for more than three weeks?
- I will have to delete all traces of a user upon request?

**How about my machine learning models trained on user data?**

# Fake-news, fake voice, fake video

The image shows a screenshot of the E! News website on the left and a video comparison on the right. The website screenshot includes the E! News logo, navigation tabs (HOME, POLITICS, HEALTH, TECH, SCIENCE, SPORTS, LIFESTYLE, WORLD), and a 'BREAKING NEWS' section with headlines such as 'Iowa Rep Threatens to PUNISH Schools Who Let Students Skip Exams After Trump Win' and 'Donald Trump Won 7.5 Million Popular Vote'. A 'POLITICS' section features a large red banner with the text 'Breaking: First Person To Be Charged For Threatening To Assassinate Donald Trump' and a sub-headline 'My life goal is to assassinate Trump! Ohio man is first to be charged for sending threatening election night tweet on election night lun...'. Below this is a map of the United States and another headline: 'Donald Trump Won 7.5 Million Popular Vote Landslide in Heartland'. A 'LIKE US ON FACEBOOK' button is also visible.

The video comparison on the right shows two side-by-side frames of a woman speaking into a microphone. The left frame is labeled 'ALTERED VIDEO' and the right frame is labeled 'ORIGINAL VIDEO'. The woman is wearing a dark blue top and has her right hand raised. The background is a blue screen with the word 'EAS' visible. A watermark '/PoliticsWatchDog' is present in the bottom left of the altered video frame.

- How to tell if something is true or false?
- How to attribute a crime with factual evidence when people can just claim it's fake?

# The rise of generative models

- We've seen Generative Adversarial Networks (GAN)
- We've also seen what GPT-3 is able to do
  - Generate text / code / table / and so on...
- More recent example: DALL-E 2

"An astronaut riding a horse in a photorealistic style."

<https://openai.com/dall-e-2/>

"Oriental painting of a lady programming on a laptop in the Song Dynasty" #DalleFF

# Safety issue in deploying AI

# Research in Responsible AI

- Issues about fairness
  - (A) I want my predictions to be calibrated on all subgroups
  - (B) I want the false-positive rate to be the same on all subgroups
  - (C) I want the false-negative rate to be the same on all subgroups

**Impossibility theorem (Kleinberg et al. 2016):** Except in trivial cases, any two of the above implies the third is impossible.

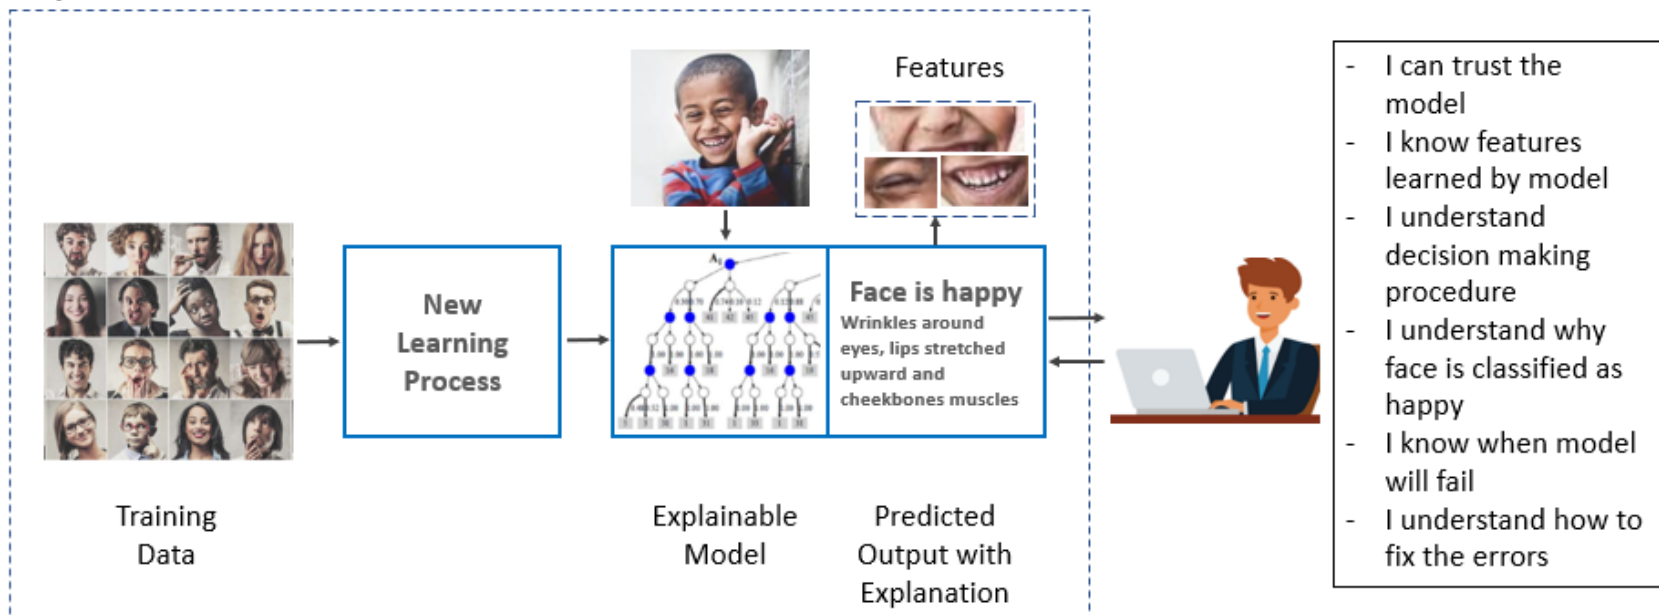

## **What is it that we want? How do we define fairness?**

- For recidivism prediction?
- For medical diagnosis?
- Do human decision makers suffer from the same issue?

# Research in Responsible AI

- Explanability of AI predictions

## Explainable AI Model

# Another example on explainable AI predictions

(a) Sheep - 26%, Cow - 17%

(b) Importance map of 'sheep'

(c) Importance map of 'cow'

(d) Bird - 100%, Person - 39%

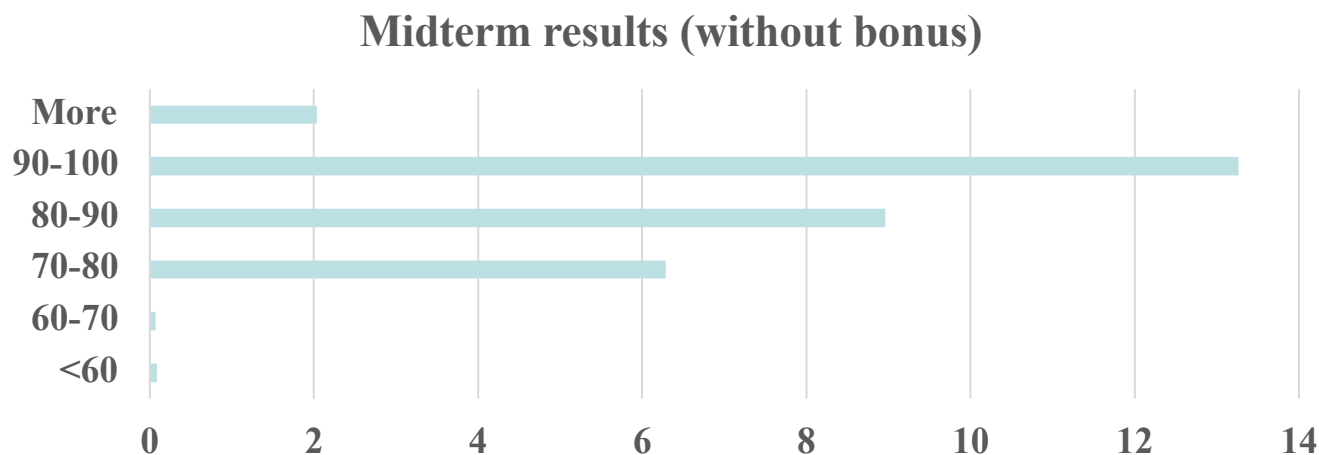

(e) Importance map of 'bird'

(f) Importance map of 'person'

# Research in Responsible AI

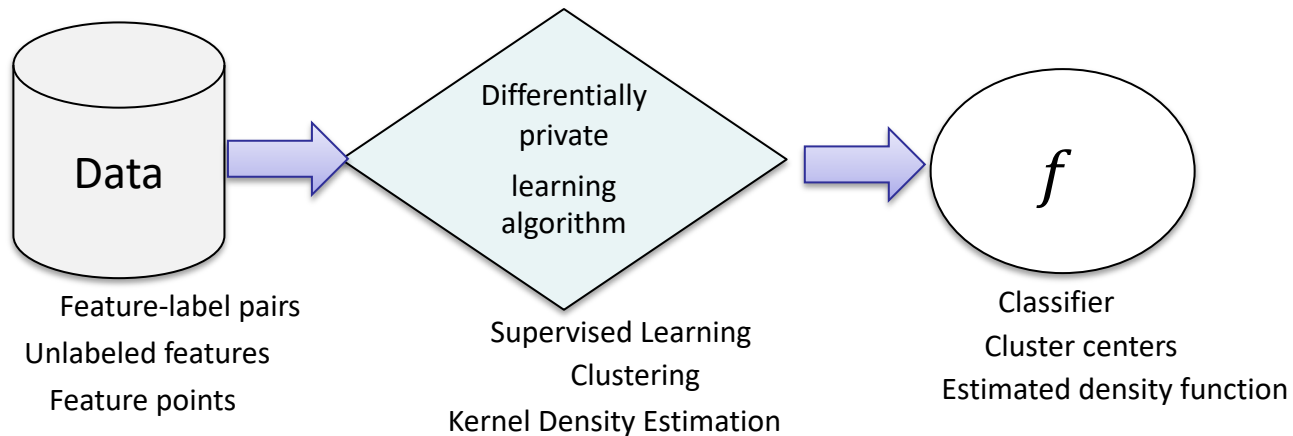

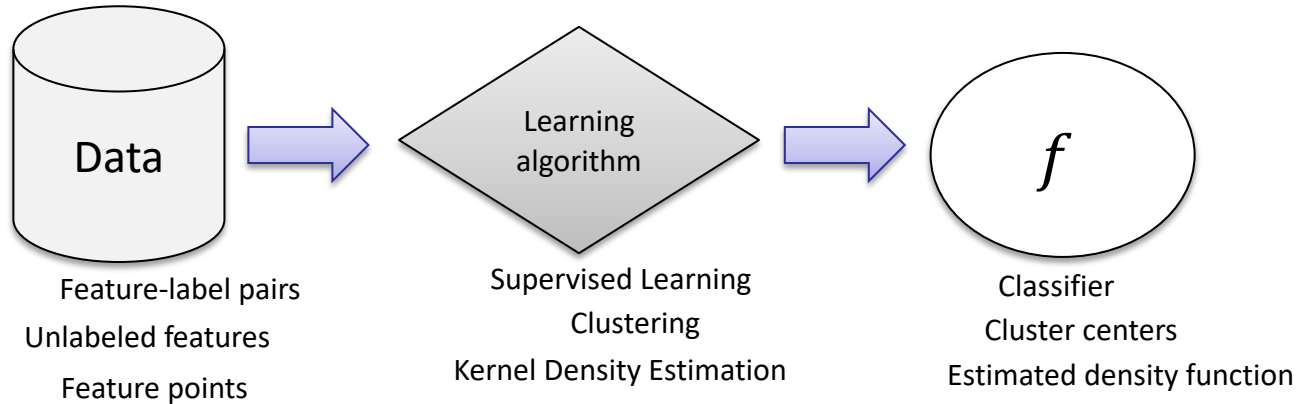

- Provable guarantees against identification in privacy

Differentially privately released midterm results from Fall 2020

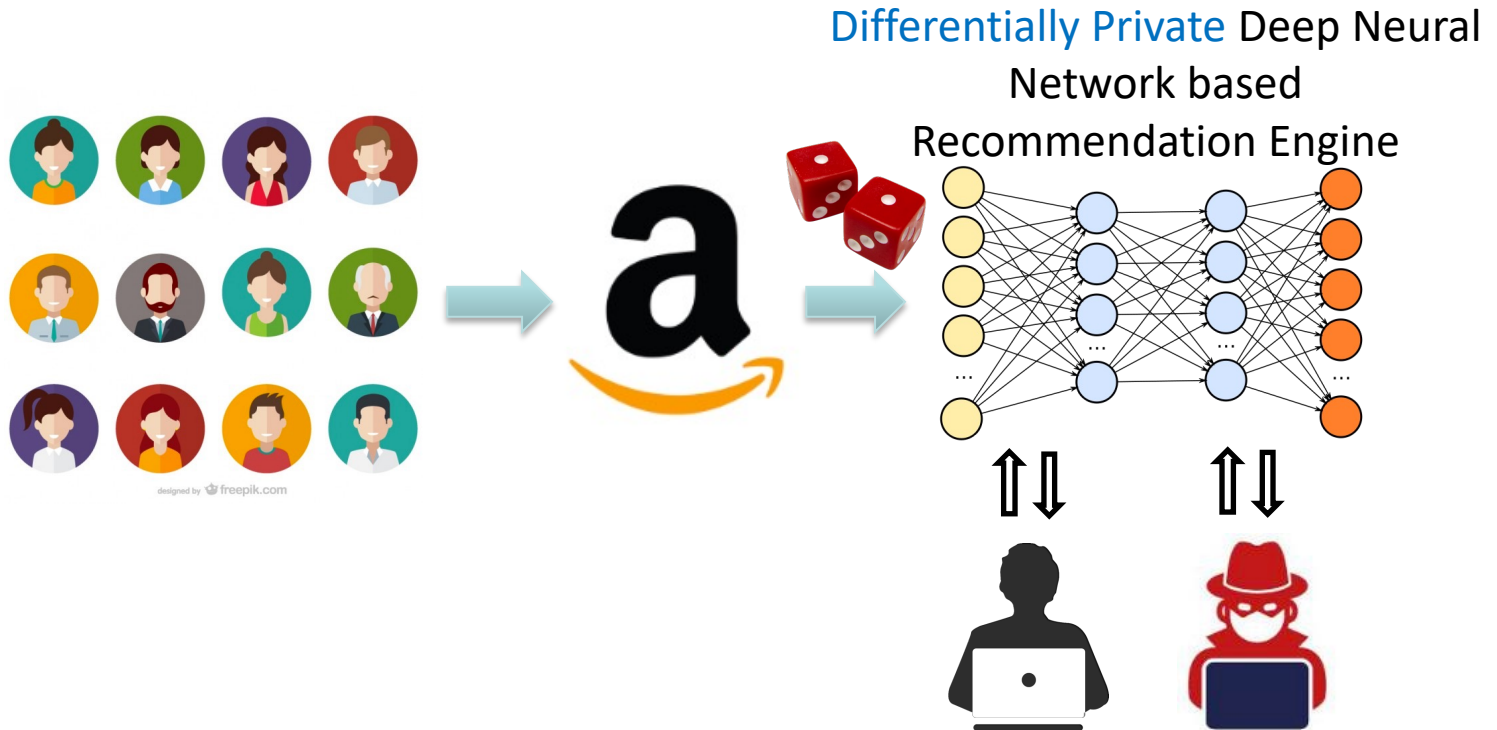

How does differential privacy work?

# Differentially Private Machine Learning

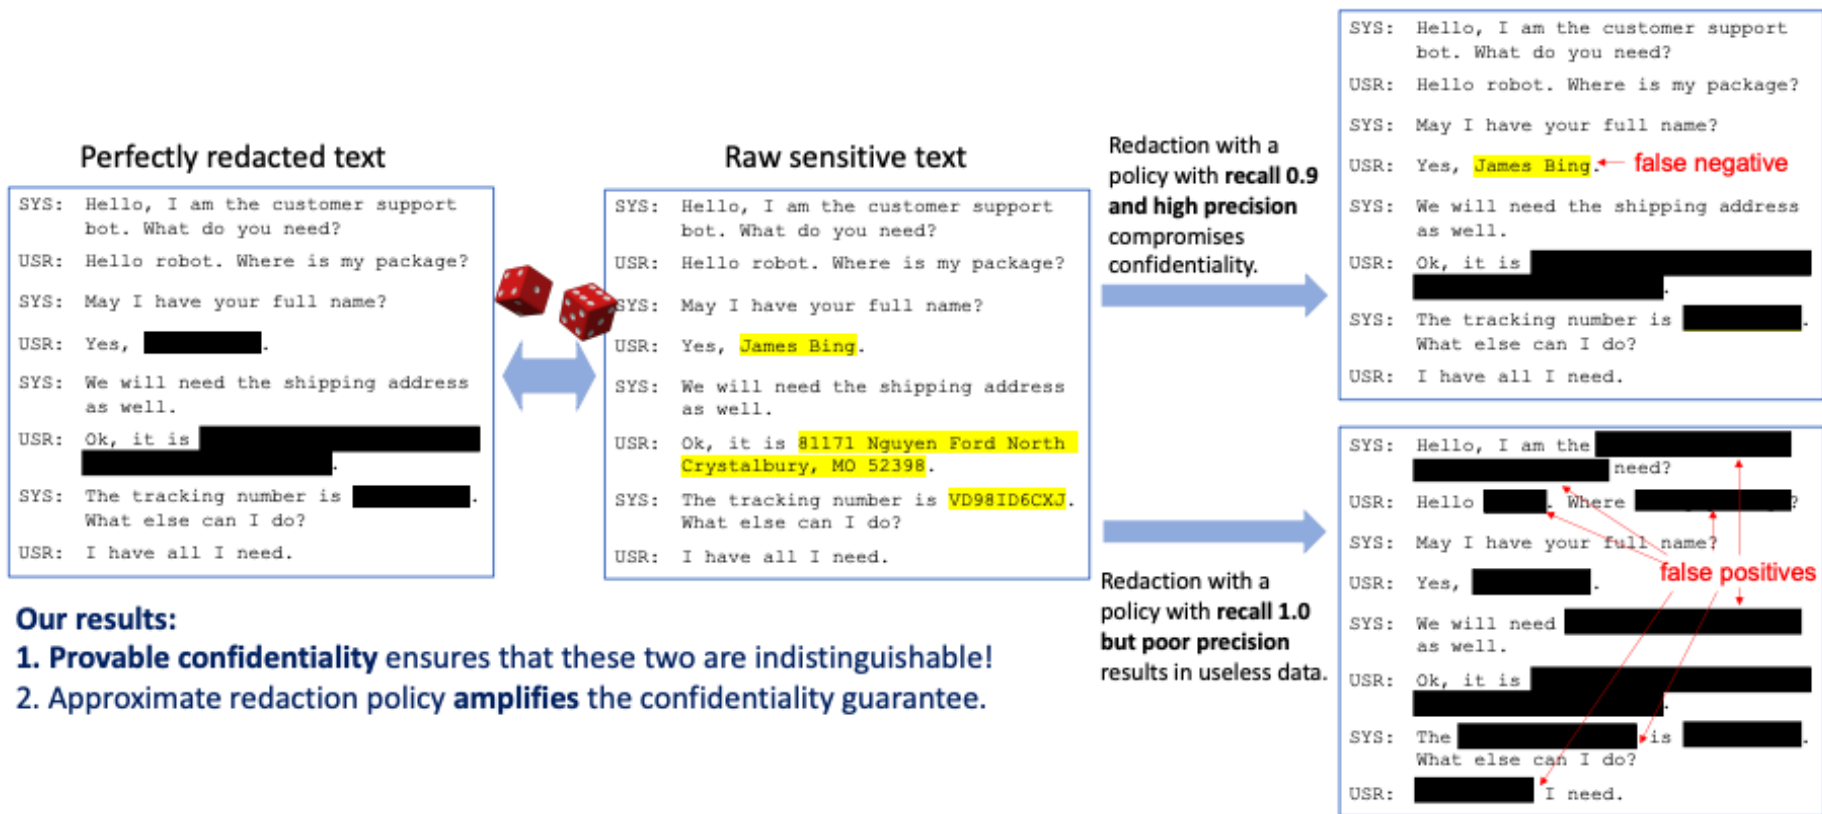

# Example: Recommender System

“If your recommendation engine is private, then an adversary can’t infer whether a particular user was present”

# Research in Responsible AI

- Differential privacy implies prevents language models from generating sensitive parts of the training data.

## Our results:

1. Provable confidentiality ensures that these two are indistinguishable!
2. Approximate redaction policy amplifies the confidentiality guarantee.

See our recent work: <https://arxiv.org/abs/2205.01863>

# UCSB Activities in Responsible AI

# Final words

- With greater power comes great responsibility.
  - Ethics in AI, Privacy, fairness, social impacts
  - Transparency, robustness, explainability
  - AI for good causes
- These are very complex issues
  - Are humans good decision makers? Are there implicit biases?
  - Can we explain our decisions
  - Should we regulate? How? To what extent?
- The future is in your hands. Be a good driver!
- Next lecture: review session for the final
