

CITS Seminar

Darren Hardy
October 2005

Agenda

— [Technology management

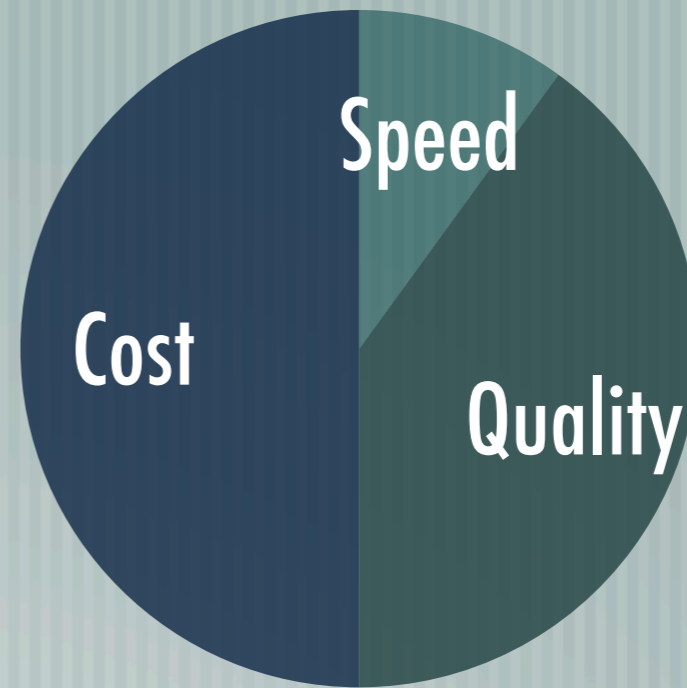

— [Environmental policy change

— [My research

Trade-offs in Engineering

"Pick Two"

mobile

google

Technology Lifecycle

	<u>Music</u>	<u>Communications</u>
<i>Bleeding Edge</i>	podcasting	CrowdSurfer
<i>Leading Edge</i>	iPod	BlackBerry
<i>State of the Art</i>	CD	mobile
<i>Dated</i>	cassette	CB
<i>Obsolete</i>	8-track	telegraph

Technology Adoption

wikipedia.org

— [Moore, 1991. Crossing the Chasm

Technology Diffusion

wikipedia.org

Rodgers, 1962. Diffusion of Innovations.

Theory: S-curve

Moore's Law

The Fifth Paradigm

Logarithmic Plot

Agenda

— [Technology management

— [Environmental policy change

— [My research

Environmentalism

Scope	Preservation	Conservation	Ecosystem	Post Modern
	1890 - 1920 Forest, Parks	1920 - 1960 Use, Pollution	1960 - 1980 NEPA, Air	1980 - 2000 Superfund
Power	Technical Negotiations	Corporate Pressure	Middle-class politics	Participatory democracy

Public policy

Actors

Public

Interest Groups

Elite

Policymakers

Courts

Institutions

Local

State

Federal

International

Environmental

SBCC

CEQA

Clean Air Act

Kyoto

Public policy change

— [Cyclical thesis

- fairly predictable pattern: private vs. public remedies

— [Backlash

- major changes based on reaction to prior policies

— [Advocacy Coalition Framework

- conflicting, informed groups responding to events

Focusing events

— [What?

- Rare, harmful, & sudden
- Known simultaneously by public & policymakers

— [Kinds?

- Natural Disasters (earthquakes, hurricanes, floods)
- Unnatural Disasters
 - Three Mile Island (1979); Chernobyl (1986);
Exxon Valdez (1989); Kuwaiti Oil Wells (1991)

Agenda

— [Technology management

— [Environmental policy change

— [My research

Wireless Sensors

Sensor types:

— movement, light, force,
temperature, audio, proximity,
humidity

Examples:

— DigiClip, eSeal, μ Parts

(Beigl 2004)

Implications of Wireless

- [Sensor networks

- Massively instrumented environments for monitoring, forecasting, and research

- [Ubiquitous computing

- Reduce barriers to civic participation

- Facilitate mobilization & information flow

Premise

— [Environmental policy domain is largely removed from public

— [Advocacy coalitions require evermore resources & expertise

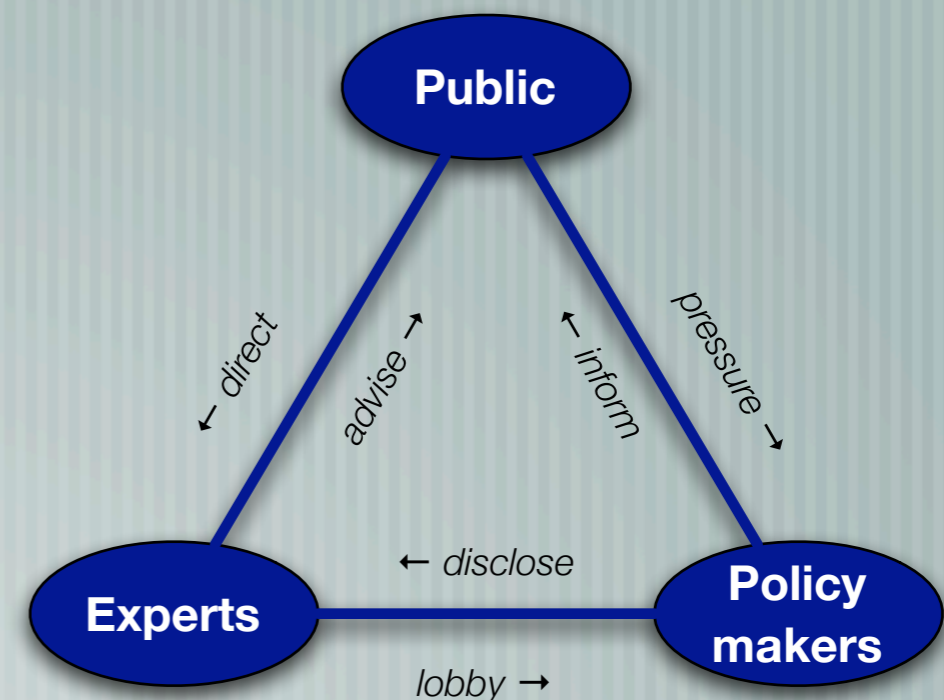

— [Large-scale access enables wide participation:
“Think locally, act globally”

— [Networked multimedia content improves outreach potential

Hypothesis

Increase in participatory democracy would affect environmental policy change positively

Distributed collaboration technology can improve quality of participation

Example

1. Major environmental disaster occurs
2. Citizen participation → flood of new media content – blogs, images, video, speeches, events, etc.
3. Collaboration network refines into “influential” assets
4. Advocacy coalitions leverage assets in policymaking

Research Questions

— [Effectiveness of distributed collaboration framework to facilitate policy change? Better outcomes?

— [Collaborative content production yield higher-valued assets?

— [Useful types of data to affect environmental policy change?
Limiting factors?
