Interests and Impact

My research is in Computer Graphics, mainly aimed at rendering photo-realistic visual appearance at real world complexity, building theoretical foundations mathematically and physically to reveal the principles of the visual world. My research interests include appearance modeling, real-time ray tracing, sampling and reconstruction theory, volumetric scattering and light transport algorithms.

I am devoted to bringing original research topics to rendering, such as detailed appearance rendering from microstructure, physical light transport, spatiotemporal frame generation, and level-of-detail rendering of large scale scenes. My contributions have been recognized through various accolades, including the SIGGRAPH 2019 Outstanding Doctoral Dissertation Award and a SIGGRAPH 2022 Best Paper Honorable Mention.

As an educator, I enjoy teaching as much as research. I have been keeping an enjoyable atmosphere in class, and making materials modern and up to date. I have created two online courses GAMES101 and GAMES202, focusing on general introduction to graphics and specific real-time rendering, respectively. Up to May 2023, they have already been played more than 2.5 million times together.
