Distributed Memory Programming with Message-Passing

Pacheco's book Chapter 3

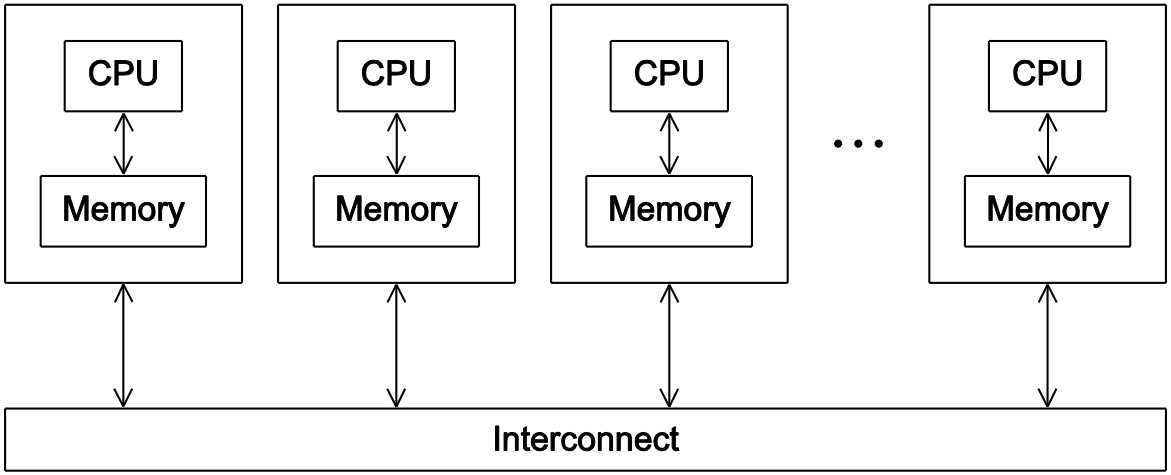
T. Yang, CS240A

Part of slides from the text book and B. Gropp

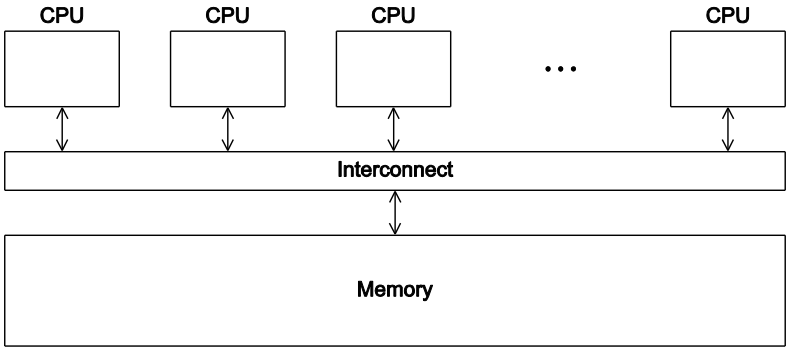
Outline

- **An overview of MPI programming**
  - Six MPI functions and hello sample
  - How to compile/run
- **More on send/receive communication**
- **Parallelizing numerical integration with MPI**

Mainly for distributed memory systems



Not targeted for shared memory machines. But can work



Message Passing Libraries

- MPI, Message Passing Interface, now the industry standard, for C/C++ and other languages
- **Running as a set of processes. No shared variables**
- **All communication, synchronization require subroutine calls**
  - Enquiries
    - How many processes? Which one am I? Any messages waiting?
  - Communication
    - point-to-point: Send and Receive
    - Collectives such as broadcast
  - Synchronization
    - Barrier

Advanced Features of MPI

- Communicators encapsulate communication spaces for library safety
- Datatypes reduce copying costs and permit heterogeneity
- Multiple communication modes allow precise buffer management
- Extensive collective operations for scalable global communication
- Process topologies permit efficient process placement, user views of process layout
- Profiling interface encourages portable tools

Slide source: Bill Gropp, ANL

MPI Implementations & References

- **The Standard itself (MPI-2, MPI-3):**
  - at http://www.mpi-forum.org
- **Implementation for Linux/Windows**
  - Vendor specific implementation
  - MPICH
  - Open MPI
- **Other information on Web:**
  - http://en.wikipedia.org/wiki/Message_Passing_Interface
  - http://www.mcs.anl.gov/mpi MPI talks and tutorials, a FAQ, other MPI pages

MPI is Simple

- Many parallel programs can be written using just these six functions, only two of which are non-trivial:
  - `MPI_INIT`
  - `MPI_FINALIZE`
  - `MPI_COMM_SIZE`
  - `MPI_COMM_RANK`
  - `MPI_SEND`
  - `MPI_RECV`
- `To measure time:  MPI_Wtime()`

Slide source: Bill Gropp, ANL

Finding Out About the Environment

- **Two important questions raised early:**
  - How many processes are participating in this computation?
  - Which one am I?
- **MPI functions to answer these questions:**
  - **`MPI_Comm_size`** reports the number of processes.
  - **`MPI_Comm_rank`** reports the *rank*, a number between 0 and size-1, identifying the calling process
    - *p* processes are numbered *0, 1, 2, .. p-1*

Slide source: Bill Gropp, ANL

Mpi_hello (C)

```
#include "mpi.h"
#include <stdio.h>

int main( int argc, char *argv[] )
{
    int rank, size;
    MPI_Init( &argc, &argv );
    MPI_Comm_rank( MPI_COMM_WORLD, &rank );
    MPI_Comm_size( MPI_COMM_WORLD, &size );
    printf( "I am %d of %d!\n", rank, size );
    MPI_Finalize();
    return 0;
}
```

Slide source: Bill Gropp, ANL

Mpi_hello (C++)

```
#include "mpi.h"
#include <iostream>

int main( int argc, char *argv[] )
{
    int rank, size;
    MPI::Init(argc, argv);
    rank = MPI::COMM_WORLD.Get_rank();
    size = MPI::COMM_WORLD.Get_size();
    std::cout << "I am " << rank << " of " << size <<
            "!\n";
    MPI::Finalize();
    return 0;
}
```

Slide source: Bill Gropp, ANL

Compilation

wrapper script to compile

source file

```
mpicc  -O  -o  mpi_hello  mpi_hello.c
```

Mix with openmp

```
mpicc  -O  -o  mpi_hello  mpi_hello.c -fopenmp
```

Execution with mpirun or mpiexec

mpirun -n <number of processes> <executable>

---

mpirun -n 1 ./mpi_hello

run with 1 process

mpirun -n 4 ./mpi_hello

run with 4 processes

Execution

```
mpirun  -n  1  ./mpi_hello

    I am 0 of 1 !
```

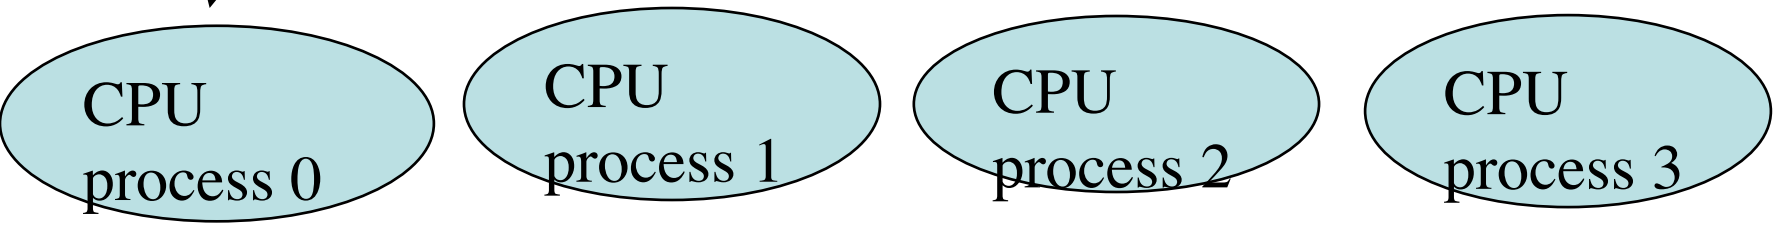
```
mpirun  -n  4  ./mpi_hello

    I am 0 of 4 !
    I am 1 of 4 !
    I am 2 of 4 !
    I am 3 of 4 !
```

mpirun -n 4 ./mpi_hello

```
#include "mpi.h"
#include <stdio.h>

int main( int argc, char *argv[] )
{
    int rank, size;
    MPI_Init( &argc, &argv );
    MPI_Comm_rank( MPI_COMM_WORLD, &rank );
    MPI_Comm_size( MPI_COMM_WORLD, &size );
    printf( "I am %d of %d!\n", rank, size );
    MPI_Finalize();
    return 0;
}
```



Running an MPI job at Comet

```
#!/bin/bash
#SBATCH --job-name="hellompi"
#SBATCH --output="hellompi.%j.%N.out"
#SBATCH --partition=compute
#SBATCH --nodes=2
#SBATCH --ntasks-per-node=24
#SBATCH --export=ALL
#SBATCH -t 01:30:00
#This job runs with 2 nodes, 24 cores per node for a total of 48 cores.
#ibrun in verbose mode will give binding detail

ibrun -v ../hello_mpi
```

MPI Programs

- **Written in C/C++.**
  - Has main.
  - Uses stdio.h, string.h, etc.
- **Need to add mpi.h header file.**
- **Identifiers defined by MPI start with "MPI_".**
- **First letter following underscore is uppercase.**
  - For function names and MPI-defined types.
  - Helps to avoid confusion.
- **MPI functions return error codes or `MPI_SUCCESS`**

MPI Components

- **MPI_Init**
  - Tells MPI to do all the necessary setup.

```
int MPI_Init(
      int*      argc_p  /* in/out */,
      char***   argv_p  /* in/out */);
```

- **MPI_Finalize**
  - Tells MPI we're done, so clean up anything allocated for this program.

```
int MPI_Finalize(void);
```

Basic Outline

```
. . .
#include <mpi.h>
. . .
int main(int argc, char* argv[]) {
   . . .
   /* No MPI calls before this */
   MPI_Init(&argc, &argv);
   . . .
   MPI_Finalize();
   /* No MPI calls after this */
   . . .
   return 0;
}
```

Basic Concepts: Communicator

- Processes can be collected into groups
  - Communicator
  - Each message is sent & received in the same communicator
- A process is identified by its rank in the group associated with a communicator
- There is a default communicator whose group contains all initial processes, called `MPI_COMM_WORLD`

Slide source: Bill Gropp, ANL

Communicators

```
int MPI_Comm_size(
      MPI_Comm   comm          /* in  */,
      int*       comm_sz_p     /* out */);
```

number of processes in the communicator

```
int MPI_Comm_rank(
      MPI_Comm   comm          /* in  */,
      int*       my_rank_p     /* out */);
```

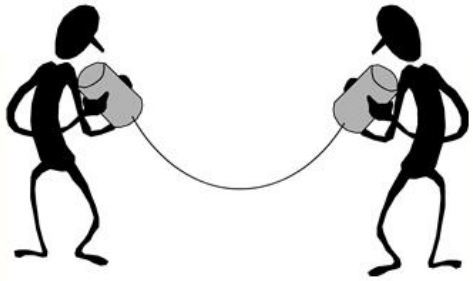
my rank
(the process making this call)

Basic Send

```
int MPI_Send(

   void*          msg_buf_p      /* in */,
   int            msg_size       /* in */,
   MPI_Datatype   msg_type       /* in */,
   int            dest           /* in */,
   int            tag            /* in */,
   MPI_Comm       communicator   /* in */);
```

- **Things specified:**
  - How will “data” be described?
  - How will processes be identified?
  - How will the receiver recognize/screen messages?



Data types

MPI datatype	C datatype
MPI_CHAR	signed **char**
MPI_SHORT	signed **short int**
MPI_INT	signed **int**
MPI_LONG	signed **long int**
MPI_LONG_LONG	signed **long long int**
MPI_UNSIGNED_CHAR	**unsigned char**
MPI_UNSIGNED_SHORT	**unsigned short int**
MPI_UNSIGNED	**unsigned int**
MPI_UNSIGNED_LONG	**unsigned long int**
MPI_FLOAT	**float**
MPI_DOUBLE	**double**
MPI_LONG_DOUBLE	**long double**
MPI_BYTE	
MPI_PACKED	

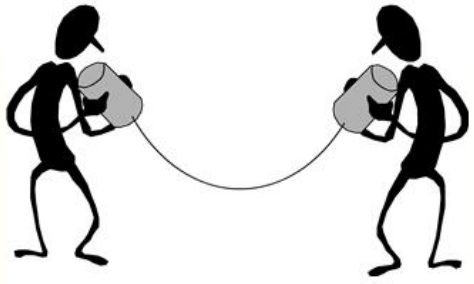
MPI Datatypes

- **The data in a message to send or receive is described by a triple (address, count, datatype), where**
- **An MPI datatype is recursively defined as:**
  - predefined, corresponding to a data type from the language (e.g., MPI_INT, MPI_DOUBLE)
  - a contiguous array of MPI datatypes
  - a strided block of datatypes
  - an indexed array of blocks of datatypes
  - an arbitrary structure of datatypes
- **There are MPI functions to construct custom datatypes, in particular ones for subarrays**
- **May hurt performance if datatypes are complex**

Slide source: Bill Gropp, ANL

Basic Receive: Block until a matching message is received

```
int MPI_Recv(
      void*          msg_buf_p      /* out */,
      int            buf_size       /* in  */,
      MPI_Datatype   buf_type       /* in  */,
      int            source         /* in  */,
      int            tag            /* in  */,
      MPI_Comm       communicator   /* in  */,
      MPI_Status*    status_p       /* out */);
```



- **Things that need specifying:**
  - Where to receive data
  - How will the receiver recognize/screen messages?
  - What is the actual message received

Message matching

```
MPI_Send(send_buf_p, send_buf_sz, send_type, dest, send_tag,
         send_comm);
```

MPI_Send

dest

MPI_Recv

src

```
MPI_Recv(recv_buf_p, recv_buf_sz, recv_type, src, recv_tag,
         recv_comm, &status);
```

Receiving messages without knowing the source

- **A receiver can get a message without knowing:**
  - the amount of data in the message,
  - the sender of the message,
    - `Specify the source as MPI_ANY_SOURCE`
  - or the tag of the message.
    - `Specify the tag as MPI_ANY_TAG`

Status argument: who sent me and what tag is?

```
MPI_Recv(recv_buf_p, recv_buf_sz, recv_type, src, recv_tag,
         recv_comm, &status);
```

MPI_Status*

Who sent me

What tag is

Error code

Actual message length

Retrieving Further Information from status argument in C

- `Status` is a data structure allocated in the user's program.
- In C:

```
int recvd_tag, recvd_from, recvd_count;
MPI_Status status;
MPI_Recv(..., MPI_ANY_SOURCE, MPI_ANY_TAG, ..., &status )
recvd_tag  = status.MPI_TAG;
recvd_from = status.MPI_SOURCE;
MPI_Get_count( &status, datatype, &recvd_count );
```

Slide source: Bill Gropp, ANL

Retrieving Further Information in C++

- `Status` is a data structure allocated in the user's program.
- In C++:

```
int recvd_tag, recvd_from, recvd_count;
MPI::Status status;
Comm.Recv(..., MPI::ANY_SOURCE, MPI::ANY_TAG, ...,
          status )
recvd_tag   = status.Get_tag();
recvd_from  = status.Get_source();
recvd_count = status.Get_count( datatype );
```

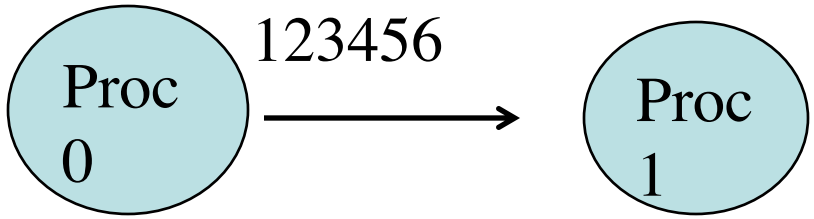
Slide source: Bill Gropp, ANL

MPI Example: Simple send/recive

```
#include "mpi.h"
#include <stdio.h>
int main( int argc, char *argv[])
{
  int rank, buf;
  MPI_Status status;
  MPI_Init(&argv, &argc);
  MPI_Comm_rank( MPI_COMM_WORLD, &rank );

  /* Process 0 sends and Process 1 receives */
  if (rank == 0) {
    buf = 123456;
    MPI_Send( &buf, 1, MPI_INT, 1, 0, MPI_COMM_WORLD);
  }
  else if (rank == 1) {
    MPI_Recv( &buf, 1, MPI_INT, 0, 0, MPI_COMM_WORLD,
              &status );
    printf( "Received %d\n", buf );
  }

  MPI_Finalize();
  return 0;
}
```



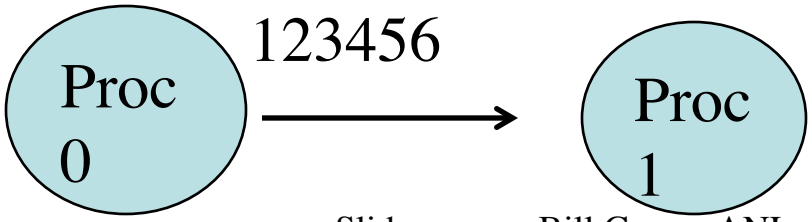
Slide source: Bill Gropp, ANL

MPI Send/Receive Example with C++

```
#include "mpi.h"
#include <iostream>
int main( int argc, char *argv[])
{
  int rank, buf;
  MPI::Init(argv, argc);
  rank = MPI::COMM_WORLD.Get_rank();

  // Process 0 sends and Process 1 receives
  if (rank == 0) {
    buf = 123456;
    MPI::COMM_WORLD.Send( &buf, 1, MPI::INT, 1, 0 );
  }
  else if (rank == 1) {
    MPI::COMM_WORLD.Recv( &buf, 1, MPI::INT, 0, 0 );
    std::cout << "Received " << buf << "\n";
  }

  MPI::Finalize();
  return 0;
}
```



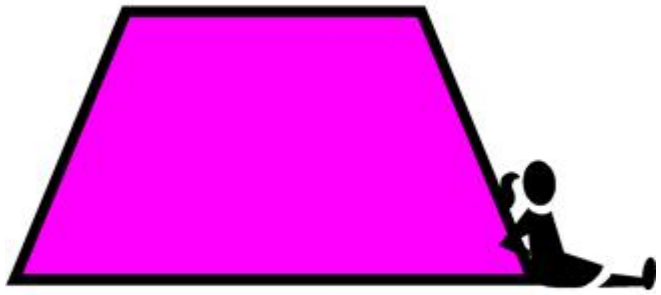
Slide source: Bill Gropp, ANL

MPI_Wtime()

- **Returns the current time with a double float.**
- **To time a program segment**
  - *Start time= MPI_Wtime()*
  - *End time=MPI_Wtime()*
  - Time spent is *end_time – start_time.*

Example of using MPI_Wtime()

```
#include<stdio.h>
#include<mpi.h>
main(int argc, char **argv){
  int size, node;            double start, end;
  MPI_Init(&argc, &argv);
  MPI_Comm_rank(MPI_COMM_WORLD, &node);
  MPI_Comm_size(MPI_COMM_WORLD, &size);
  start = MPI_Wtime();
  if(node==0)  {
      printf(" Hello From Master. Time = %lf \n", MPI_Wtime() -
   start);
}
  else  {
      printf("Hello From Slave #%d %lf \n", node, (MPI_Wtime()
   - start));
    }
  MPI_Finalize();
}
```



MPI Example: Numerical Integration With Trapezoidal Rule

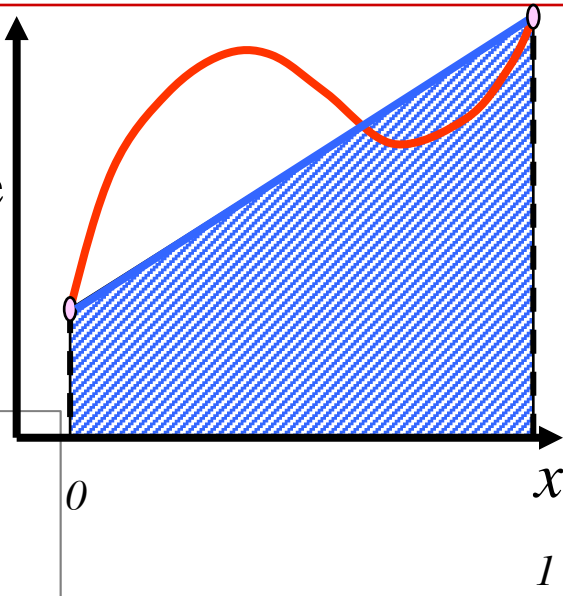
PACHECO'S BOOK p. 94-101

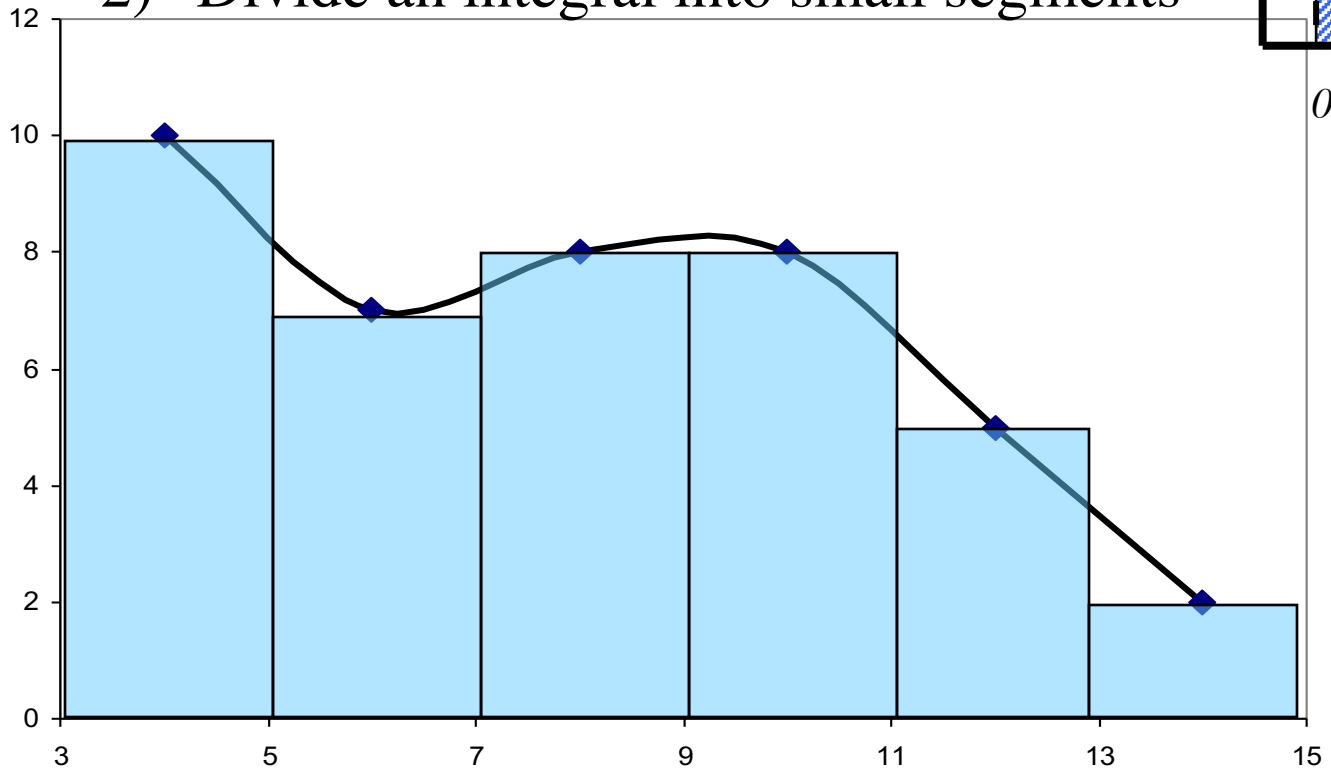
Approximation of Numerical Integration

Two ideas

1) Use a simple function to approximate the integral area.

2) Divide an integral into small segments



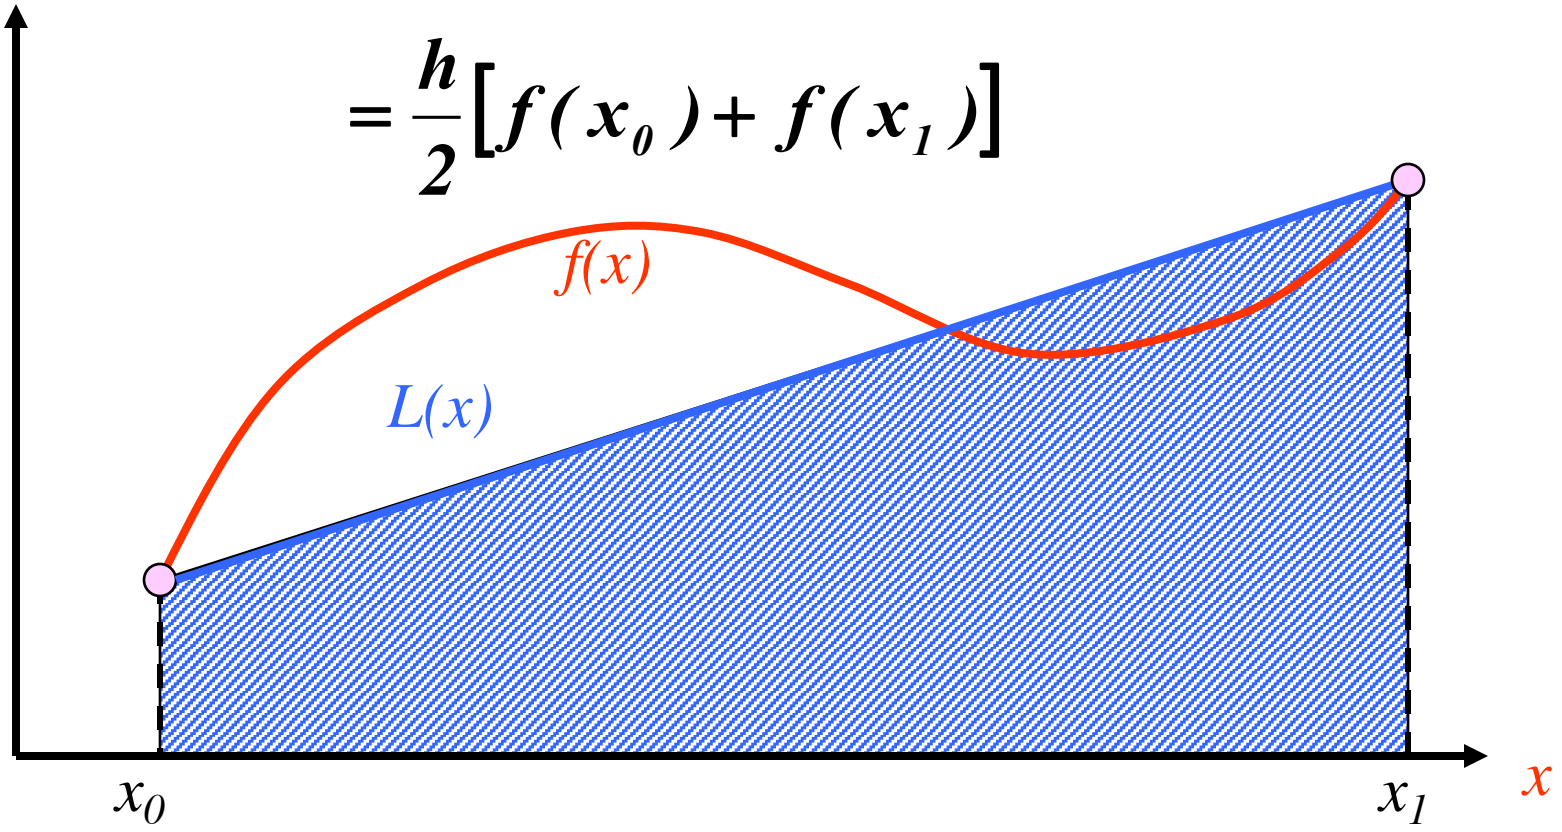


Trapezoid Rule

- **Straight-line approximation**

$$\int_a^b f(x)dx \approx \sum_{i=0}^{1} c_i f(x_i) = c_0 f(x_0) + c_1 f(x_1)$$

$$= \frac{h}{2}\left[f(x_0) + f(x_1)\right]$$



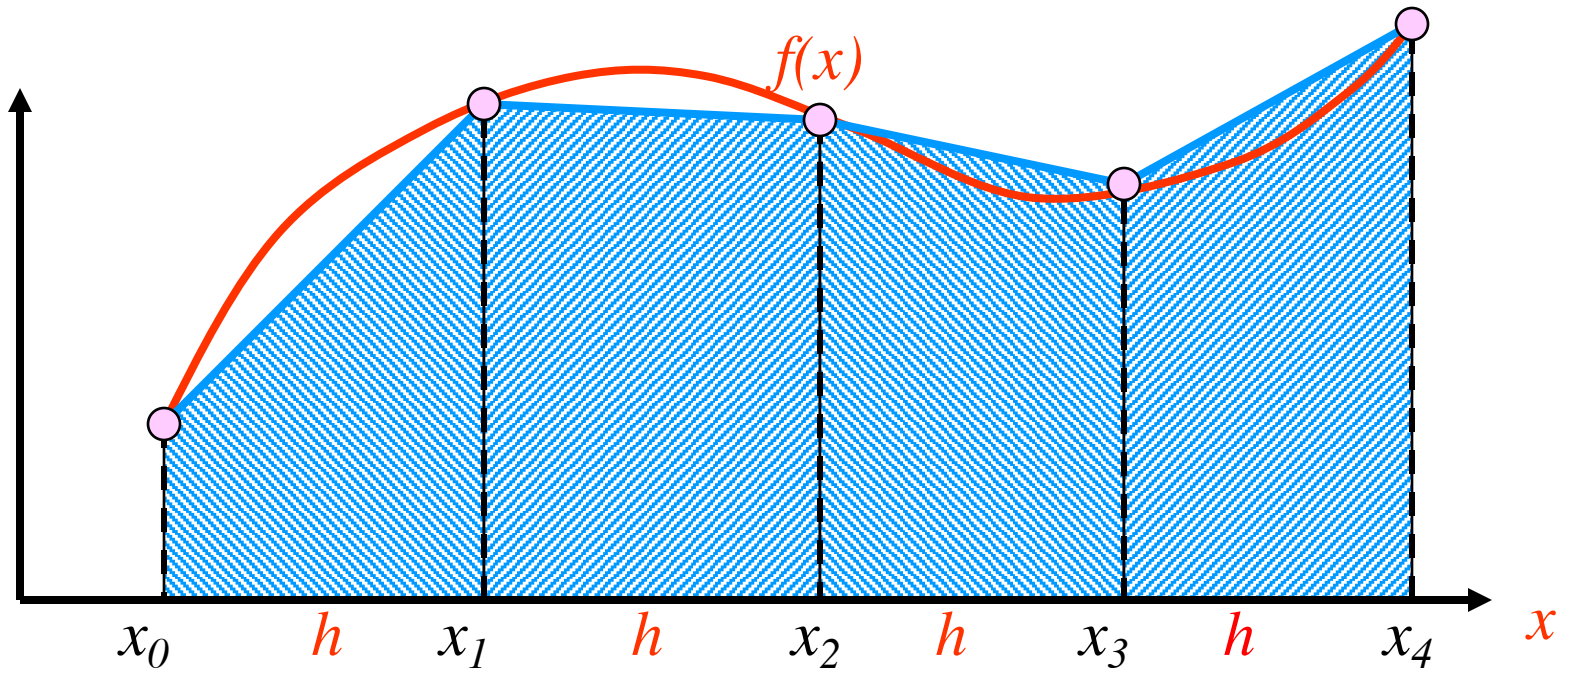
Composite Trapezoid Rule

$$\int_a^b f(x)dx = \int_{x_0}^{x_1} f(x)dx + \int_{x_1}^{x_2} f(x)dx + \cdots\cdots + \int_{x_{n-1}}^{x_n} f(x)dx$$

$$= \frac{h}{2}\left[f(x_0) + f(x_1)\right] + \frac{h}{2}\left[f(x_1) + f(x_2)\right] + \cdots + \frac{h}{2}\left[f(x_{n-1}) + f(x_n)\right]$$

$$= \frac{h}{2}\left[f(x_0) + 2f(x_1) + \cdots + 2f(x_i) + \cdots + 2f(x_{n-1}) + f(x_n)\right]$$

$$h = \frac{b-a}{n}$$



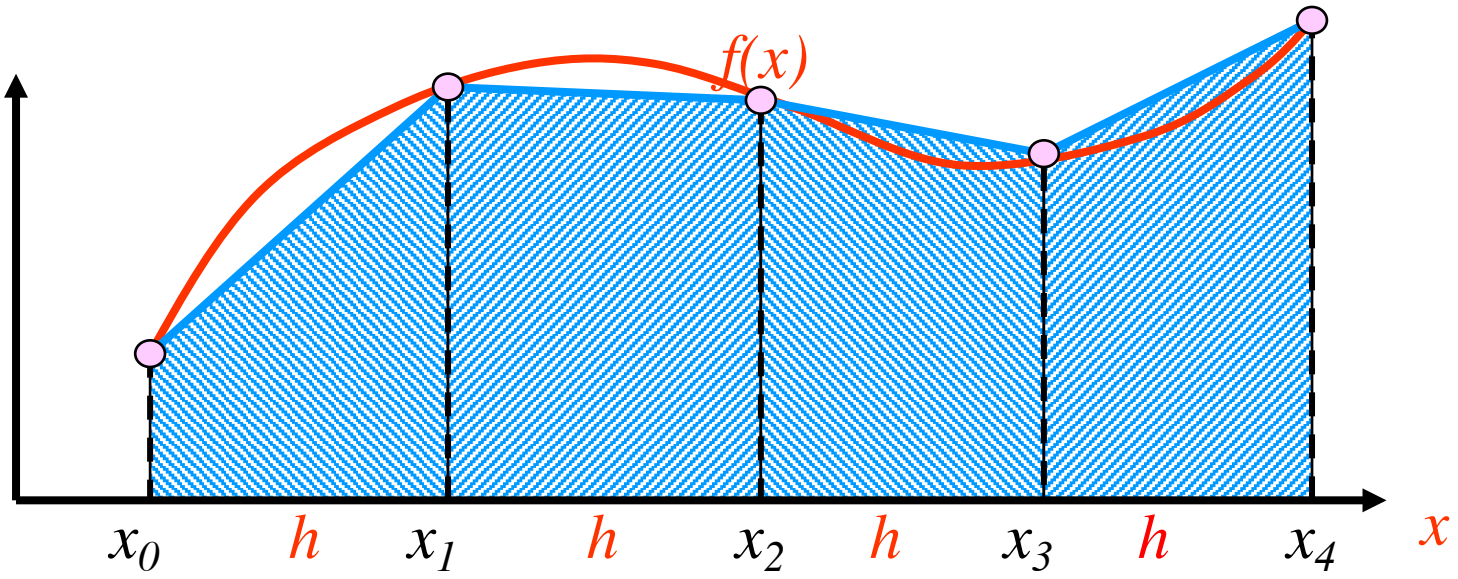
Implementing Composite Trapezoidal Rule

$$\text{Area of one trapezoid} = \frac{h}{2}[f(x_i) + f(x_{i+1})]$$

$$x_0 = a,\ x_1 = a + h,\ x_2 = a + 2h,\ \ldots,\ x_{n-1} = a + (n-1)h,\ x_n = b$$

$$\text{Sum of trapezoid areas} = h[f(x_0)/2 + f(x_1) + f(x_2) + \cdots + f(x_{n-1}) + f(x_n)/2]$$

$$h = \frac{b-a}{n}$$



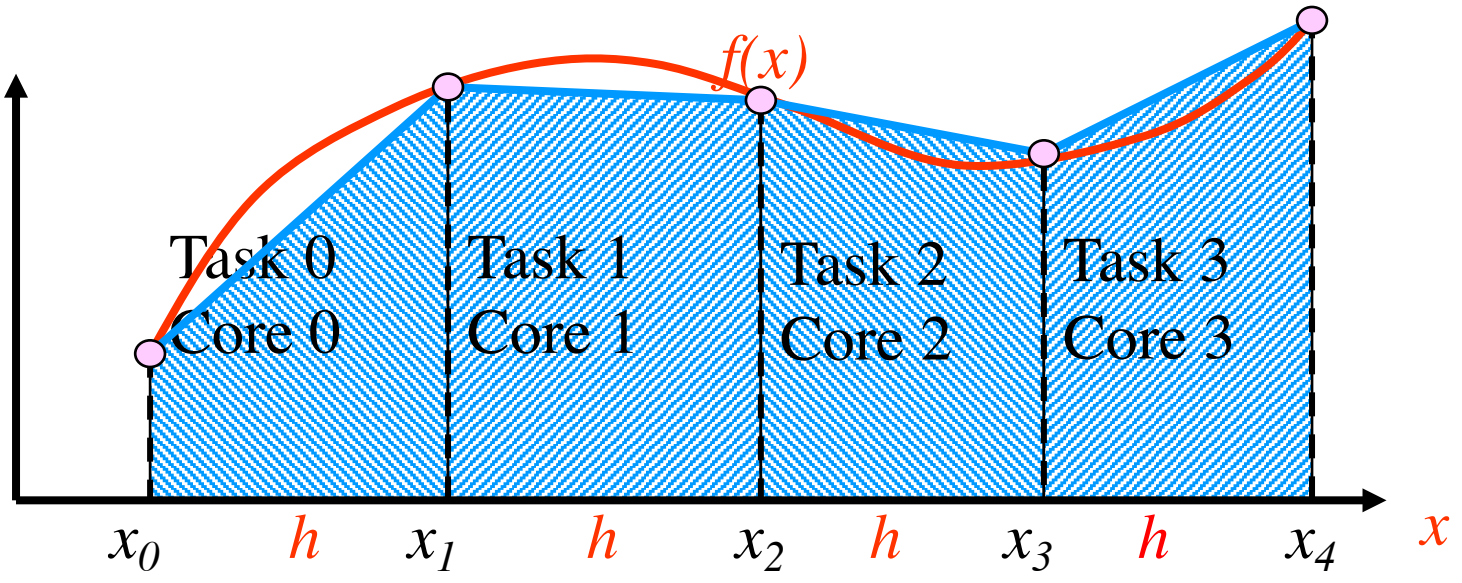
Pseudo-code for a serial program

```
/* Input:  a, b, n */
h = (b-a)/n;
approx = (f(a) + f(b))/2.0;
for (i = 0; i <= n-1; i++) {
    x_i = a + i*h;
    approx += f(x_i);
}
approx = h*approx;
```

Parallelizing the Trapezoidal Rule

1. Partition problem solution into tasks.
2. Identify communication channels between tasks.
3. Aggregate tasks into composite tasks.
4. Map composite tasks to cores.

$$h = \frac{b-a}{n}$$



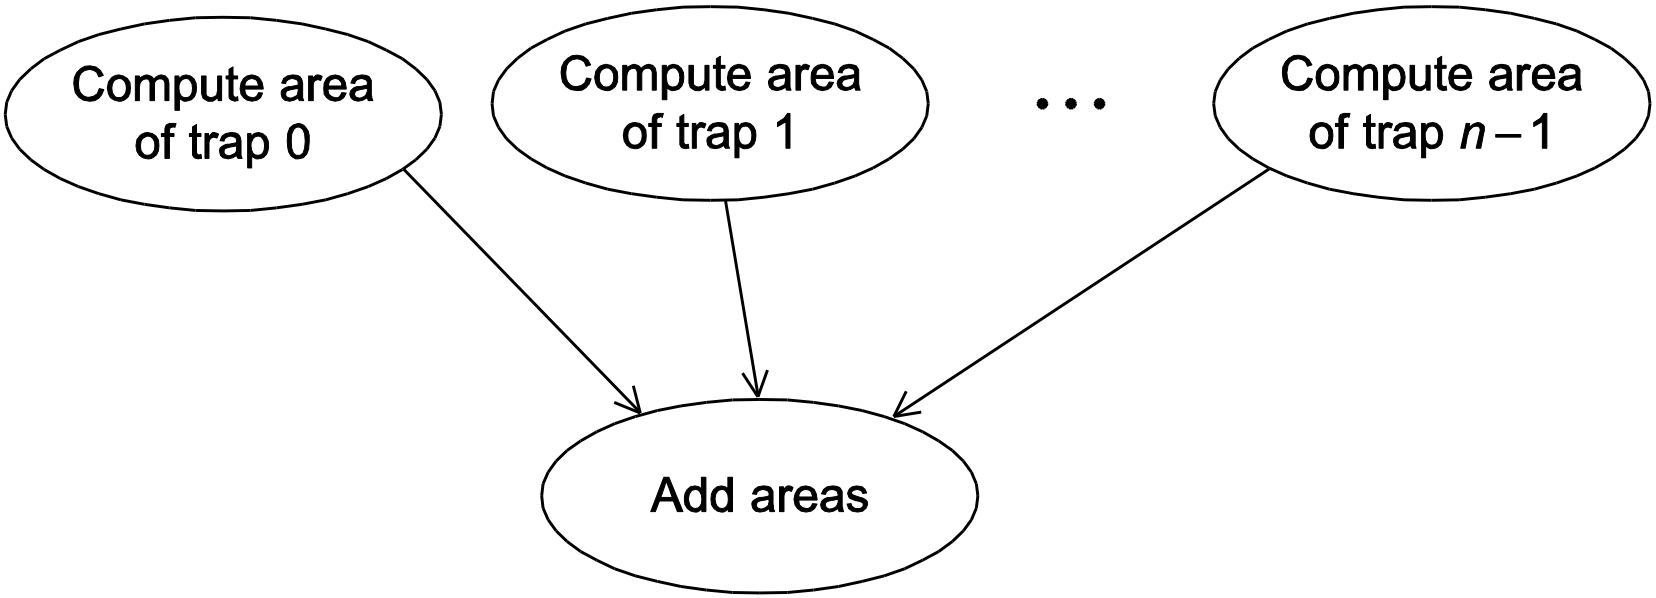
Parallel pseudo-code

```
1     Get a, b, n;
2     h = (b-a)/n;
3     local_n = n/comm_sz;
4     local_a = a + my_rank*local_n*h;
5     local_b = local_a + local_n*h;
6     local_integral = Trap(local_a, local_b, local_n, h);
7     if (my_rank != 0)
8        Send local_integral to process 0;
9     else /* my_rank == 0 */
10       total_integral = local_integral;
11       for (proc = 1; proc < comm_sz; proc++) {
12          Receive local_integral from proc;
13          total_integral += local_integral;
14       }
15    }
16    if (my_rank == 0)
17       print result;
```

Compute the local area

Summation of local values

Tasks and communications for Trapezoidal Rule



First version (1)

```
1  int main(void) {
2     int my_rank, comm_sz, n = 1024, local_n;
3     double a = 0.0, b = 3.0, h, local_a, local_b;
4     double local_int, total_int;
5     int source;
6
7     MPI_Init(NULL, NULL);
8     MPI_Comm_rank(MPI_COMM_WORLD, &my_rank);
9     MPI_Comm_size(MPI_COMM_WORLD, &comm_sz);
10
11    h = (b-a)/n;           /* h is the same for all processes */
12    local_n = n/comm_sz;   /* So is the number of trapezoids  */
13
14    local_a = a + my_rank*local_n*h;
15    local_b = local_a + local_n*h;
16    local_int = Trap(local_a, local_b, local_n, h);
17
18    if (my_rank != 0) {
19       MPI_Send(&local_int, 1, MPI_DOUBLE, 0, 0,
20             MPI_COMM_WORLD);
```

Use send/receive to sum

First version (2)

```
21      } else {
22         total_int = local_int;
23         for (source = 1; source < comm_sz; source++) {
24            MPI_Recv(&local_int, 1, MPI_DOUBLE, source, 0,
25                  MPI_COMM_WORLD, MPI_STATUS_IGNORE);
26            total_int += local_int;
27         }
28      }
29
30      if (my_rank == 0) {
31         printf("With n = %d trapezoids, our estimate\n", n);
32         printf("of the integral from %f to %f = %.15e\n",
33             a, b, total_int);
34      }
35      MPI_Finalize();
36      return 0;
37   } /*  main  */
```

Use send/receive to sum

First version: Trapezoidal Rule of local area

```
1  double Trap(
2        double left_endpt  /* in */,
3        double right_endpt /* in */,
4        int    trap_count  /* in */,
5        double base_len    /* in */) {
6     double estimate, x;
7     int i;
8
9     estimate = (f(left_endpt) + f(right_endpt))/2.0;
10    for (i = 1; i <= trap_count-1; i++) {
11       x = left_endpt + i*base_len;
12       estimate += f(x);
13    }
14    estimate = estimate*base_len;
15
16    return estimate;
17 } /*  Trap  */
```

I/O handling in trapezoidal program

- **Most MPI implementations only allow process 0 in MPI_COMM_WORLD access to stdin.**
- **Process 0 must read the data (scanf) and send to the other processes.**

```
. . .
MPI_Comm_rank(MPI_COMM_WORLD, &my_rank);
MPI_Comm_size(MPI_COMM_WORLD, &comm_sz);

Get_data(my_rank, comm_sz, &a, &b, &n);

h = (b-a)/n;
. . .
```

Function for reading user input

```
void Get_input(
      int       my_rank   /* in  */,
      int       comm_sz   /* in  */,
      double*   a_p       /* out */,
      double*   b_p       /* out */,
      int*      n_p       /* out */) {
   int dest;

   if (my_rank == 0) {
      printf("Enter a, b, and n\n");
      scanf("%lf %lf %d", a_p, b_p, n_p);
      for (dest = 1; dest < comm_sz; dest++) {
         MPI_Send(a_p, 1, MPI_DOUBLE, dest, 0, MPI_COMM_WORLD);
         MPI_Send(b_p, 1, MPI_DOUBLE, dest, 0, MPI_COMM_WORLD);
         MPI_Send(n_p, 1, MPI_INT, dest, 0, MPI_COMM_WORLD);
      }
   } else { /* my_rank != 0 */
      MPI_Recv(a_p, 1, MPI_DOUBLE, 0, 0, MPI_COMM_WORLD,
            MPI_STATUS_IGNORE);
      MPI_Recv(b_p, 1, MPI_DOUBLE, 0, 0, MPI_COMM_WORLD,
            MPI_STATUS_IGNORE);
      MPI_Recv(n_p, 1, MPI_INT, 0, 0, MPI_COMM_WORLD,
            MPI_STATUS_IGNORE);
   }
}  /* Get_input */
```

Process 0 inputs parameters

Broadcast parameters
